HIBISCUS CHATTER

– Anton Kuhn, Fioton Nursery, Miami, Florida.

Hibiscus Rosa Sinensis is by far the most consistant flowering shrub in tropical and semi-tropical climates. Hibiscus plants have been developed greatly in the past few years and can be grown satisfactorily now with reasonable amount of care. If you can grow Roses, Azaleas or Camellias, you can most certainly grow Hibiscus.

A complete fertilizer is recommended to grow better and sturdier plants, it consists of commercial fertilizer 4-4-8 or 4-7-5, using it half and half with sheep's manure. First off, test your soil for the Ph (Condition of soil). For successful growing the Ph should be slightly acid from 6. to 6.5. This Ph will render your soil correct for accepting the available elements in the fertilizer that you will use, as well as make your plant less susceptible to disease. Healthy plants like healthy people are not bothered with disease.

If your plants seem to be stunted in growth, dissolve one tablespoon of Hyponex and one teaspoon of detergent soap powder in one gallon of water, and spray this mixture on leaves and stems. You will find this most beneficial to produce added and more vigorous growth. Water your plants at least four hours before applying fertilizer or spray, do this satering by 11A.M. and not more than once a week if necessary.

If your Hibiscus should get the "Blacksplash", cut back all the infested wood to about 4 inches below the infestation. Watch for this disease especially in the late hot summer months.

Hybridizers have developed flowers of many exciting colors. The shapes of Hibiscus blooms are single, semi-double, loose and full double, some of the new hybrids being up to 13 inches in diameter – (Singles). Flowers are becoming more and more ruffled and tufted, crested, and fully overlapped petals. Hybridizers are
